IMPROVE CLEANING PRACTICES

FEATURE OVERVIEW

The intent of this feature is to provide effective cleaning by establishing adequate cleaning protocols and practices.

Surfaces may host pathogens released by sick individuals or through contact with another contaminated surface. Indiscriminate use of cleaning sprays is suspected to be a risk factor for adult asthma. Microorganisms such as dust mites are directly related with asthma and allergy development.

HIGHLIGHTS OF WHAT WE’VE DONE

- **DISINFECT HIGH TOUCH SURFACES**
  High touch surfaces are disinfected on a daily basis in our building.

- **MONTHLY ATP TESTING**
  We conduct adenosine triphosphate (ATP) testing of high touch surfaces to check for high levels of organic materials including microorganisms.

- **CARPET CLEANING**
  We have carpet in high traffic areas, such as building entrances, cleaned on a monthly basis and vacuumed nightly.

- **CORONAVIRUS DISINFECTANTS**
  We utilize cleaning materials listed on the EPA’s N List which are qualified disinfectants for coronavirus.

BENEFITS

By establishing cleaning plans that balance the efficiency and efficacy of cleaning practices along with environmental impact, the health and well-being of occupants and janitorial staff are more properly considered.
