DEVELOP LEGIONELLA MANAGEMENT PLAN

FEATURE OVERVIEW

The intent of this feature is to implement protocols to reduce risk of Legionella colonization.

Legionella bacteria is naturally present in waters at low concentrations, but it may colonize recirculated water systems and can cause lung disease and worse if contaminated water is ingested by an individual.

HIGHLIGHTS OF WHAT WE’VE DONE

TEST WATER QUALITY
We test the quality of water in our building annually for Legionella and other contaminants.

IDENTIFIED WATER FEATURES
Identified a list of all water features throughout our facility to ensure they were all accounted for and tested appropriately.

ASSESS WATER SYSTEMS
Conduct monthly or annual assessments of all water systems for appropriate operations.

BENEFITS
Implementing a proper Legionella management plan should reduce the risk of exposure to pathogenic bacteria.
